Inquiry into signed languages has added to what is known about structural variation and language, language learning, and cognitive processing of language. However, comparatively little research has focused on communication disorders in signed language users. For some deaf children, atypicality is viewed as a phase that they will outgrow, and this results in late identification of linguistic or cognitive deficits that might have been addressed earlier. This volume takes a step towards describing different types of atypicality in language communicated in the signed modality such as linguistic impairment caused by deficits in visual processing, difficulties with motor movements, and neurological decline. Chapters within the book also consider communication differences in hearing children acquiring signed and spoken languages.

The fourth edition highlights the use of cognitive test results in planning school-based interventions. Multilingual Aspects of Signed Language Communication and Disorder

The chapters in this volume focus on one important aspect of writing: spelling. There has been much less research on spelling and writing than on reading, and these papers represent an attempt to restore the balance. The papers, by some of the leading researchers in the field, provide an excellent sample of current research on spelling. Some of the papers focus on spelling as a linguistic process, examining the phonological and morphological factors that make certain words easier or harder to spell than others. Other papers treat spelling as a cognitive process, looking for example at the effects of task demands on performance. And still other papers view spelling as a developmental process, asking how children learn to spell and why some children experience more difficulty than others. Together, the papers reveal the progress that has been made in our understanding of spelling.
