Protecting the health and safety of health care workers is vital to the health of each of us. Preparing for and responding to a future influenza pandemic or to a sustained outbreak of an airborne transmissible disease requires a high-level commitment to respiratory protection for health care workers across the wide range of settings in which they work and the jobs that they perform. Keeping health care workers healthy is an ethical commitment both in terms of addressing the occupational risks faced by health care workers and of providing for the continuity of patient care and services needed to maintain the health of individuals and communities. During a public health emergency, challenges will arise concerning the availability of respiratory protective devices (i.e., respirators). Reusable respirators (specifically, reusable half-facepiece elastomeric respirators) are the standard respiratory protection device used in many industries, and they provide an option for use in health care that has to date not been fully explored. The durability and reusability of elastomeric respirators make them desirable for stockpiling for emergencies, where the need for large volumes of respirators can be anticipated. However, they are used infrequently in health care. Reusable Elastomeric Respirators in Health Care explores the potential for the use of elastomeric respirators in the U.S. health care system with a focus on the economic, policy, and implementation challenges and opportunities. This report examines the practicability of elastomeric use in health care on a routine basis and during an influenza pandemic or other large aerosol-transmissible outbreak, when demand for respiratory protective devices by U.S. health care personnel may be larger than domestic supplies. The report also addresses the issues regarding emergency stockpile management of elastomeric respiratory protective devices.

This book is a non-encyclopedic introductory textbook of industrial hygiene. Based on years of teaching a single-semester course on the topic, it presents a broad survey of the field and addresses the typical student. Introduction to Industrial Hygiene is divided into three sections. The first section focuses on chemical hazards, presenting the basics of toxicology, the problems of skin contact and inhalation, the detection and control of airborne contaminants, and the threat of fire or explosion. The first part also describes government regulations and the agencies that enforce them. The second part of the book discusses injury from physical causes, including sound, radiation, heat, and accidents. This part also contains an introduction to ergonomics. The third part describes a range of industries that are major sources of both employment and potential injury, and it applies the principles outlined in the first two parts. At the end of each chapter, the material covered is summarized in a Key Points section. References are provided both to background material and to sources that expand beyond the scope of the chapter. Problems sets have practical bases and lead students into the CFR to familiarize them with the contents and the manner of locating information in the

CFR. Extensive appendices provide practical information and allow the text to continue being a valuable source of reference for the student.

The substantial burden of death and disability that results from interpersonal violence, road traffic injuries, unintentional injuries, occupational health risks, air pollution, climate change, and inadequate water and sanitation falls disproportionately on low- and middle-income countries. Injury Prevention and Environmental Health addresses the risk factors and presents updated data on the burden, as well as economic analyses of platforms and packages for delivering cost-effective and feasible interventions in these settings. The volume's contributors demonstrate that implementation of a range of prevention strategies-presented in an essential package of interventions and policies-could achieve a convergence in death and disability rates that would avert more than 7.5 million deaths a year.
