Being healthy is much more than being physically fit and free from disease. Health

is the state of well-being in which all of the components of health -- physical, emotional, social, mental, spiritual, and environmental -- are in balance. To be truly healthy, you must take care of all six components. - p. 11.

"This volume seeks make an intervention in the fields of film studies and visual culture by examining projection as a pivotal element in the continuing technological becoming of media systems. The chapters come together to paint a picture of projection that incorporates a range of practices across time and space. From studies of traveling projectionists in early 20th century Scotland and modern-day Uruguay to considerations of the (almost) lost mediums of the slide tape and the magic lantern, the authors invite us to consider the varied nature of the technologies, apparatuses, practices and histories of projection in a holistic manner. In doing so, the volume departs from the psychological metaphors of projection often employed by apparatus theory, instead emphasizing the performative character of the moving image and the labor of the various actors involved in the utterance of such texts"--

#### **Advanced Calculus**

An authorised reissue of the long out of print classic textbook, Advanced Calculus by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention Differential and Integral Calculus by R Courant, Calculus by T Apostol, Calculus by M Spivak, and Pure Mathematics by G Hardy. The reader should also have some

experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.
