and the Pacific organized an international workshop, entitled "Forest Insects as Food: Humans Bite Back" in Chiang Mai, Thailand, in February 2008. The workshop brought together many of the world's foremost experts on entomophagy – the practice of eating insects. Specialists in the three-day workshop focused specifically on the science management, collection, harvest, processing, marketing and consumption of edible forest insects, as well as their potential to be reared commercially by local farmers.

Ecofriendly Pest Suppression

Insects are major pests of both natural and plantation forests in the tropics. This book is the first to provide a broad-based, international review of this subject at a level suitable for advanced students and practitioners. It describes the ecology and biology of the insects with special reference to the economic damage they cause to trees. All relevant control strategies are addressed. It is suitable for students, researchers and practitioners of forestry, ecology, pest management and entomology in tropical and subtropical countries.

Parasite and predator complexes comprise essential components in the management of Forest Ecosystems serving to reduce insect pest depredations. To sustain natural growth of social forestry stands, nurseries and plantation crops such as Teak, Tea, Cardamom, effective steps taken to control insect pests through the utilization of natural enemies as a component of IPM will yield positive results. Being the first of its kind in the area of biological control in relation to insect pests of social forestry, this book besides laying special emphasis on the biology and ecology of major biocontrol agents, also highlights several potential biological control agents like the reduviids, ants and spiders. The extent of control these agents can exercise on their pest populations as well as the rate at which they can build-up their populations are evident from bioenergetics and life-table studies. This volume which is the outcome of a National Seminar held at the Entomology Research Institute, Loyola College, Madras provides a wealth of information of considerable significance to Forestry research and management.

resistance and environmental contamination through residues in food chain and destruction of biodiversity of resistant plants and beneficial insects. This volume hears the essential contributions from Eminent Scientists from a wide variety of research institutions, demonstrating alternative strategies and forming concrete ideas to tackle the pressing issue.
