## **Introduction to Health Care Management**

This fourth edition is intended for university students who may have an interest in becoming employed in the parks profession. The book explores the responsibilities of staff and the problems and challenges associated with managing parks in the 21st century. Particular attention is paid to the structure of park organisations, planning, decision making, and politics that ultimately influence the way parks are managed. Part I provides an overview of parks and park management. Historical aspects of the development of parks are reviewed and detailed. Part II specifically addresses the multitude of park administrative functions, such as organisational structures, park policies, laws and risk management, funding, personnel, and concludes with maintenance and safety concerns. Part III provides information on resource planning and management of the resources through citizen involvement, planning, facilities, and environmental management issues. Part IV is an overview

of visitor use issues and protection of parks. Topics include visitor conflicts, vandalism, law enforcement, fire management, interpretation, and visitor management services. Finally, Part V provides a broad overview and examples of sustainable practices in park management, including tools such as ROS, LAC, and VERP and possible solutions to the numerous challenges that park managers must address. It is our belief that sustainable management practices and planning practices designed with environmental management and visitor management are the keys to successful park operations. Similar to the 3rd edition, the 4th edition utilises where applicable the practical and sage advice of Grant W Sharpe, Charles H Odegaard, and Wenonah Finch Sharpe in the earlier editions of this book. We have retained the essence of the material, and the broad topics that those authors provided as a framework for park management. Readers will note that some references are older. We retained references that have historical significance and have been overlooked in the current literature, which are included at the end of each chapter under General References. Some of these ideas are currently accepted as common knowledge; however, we all can benefit from understanding the origin of ideas that have influenced park management.

Get 12 months FREE access to an interactive eBook when purchasing the paperback\* Reflecting the global nature of the workplace with its use of real world examples and case studies, Nick Wilton's book is not another 'How to' of HRM in practice, but goes beyond the prescriptive approach to the practice of strategic HRM and encourages critical reflection to prepare students for the issues and dilemmas they could face in their careers. Providing an introduction to the management of people in work organizations, it seeks to outline the purpose and operation of HRM activities in the 'real world', whilst situating practice in the context of associated debates and controversies played out in the parallel field of academic study. It adopts a critical perspective on the study and practice of HRM to provide the reader with an understanding not only of the potential for HRM to contribute to both improved organizational performance and individual well-being in the workplace, but also why it very often fails to achieve either of these positive outcomes and suggests that the management of people is not the exclusive preserve of HR specialists, but an area of interest or concern for all organizational actors. The new edition comes packed with features that encourage readers to engage and relate theory to practice including: - Management skills and attributes

boxes outlining the required competencies of line managers and HR practitioners - HR in practice boxes illustrating how HRM theory works in real world practice - Ethical insights presenting ethical considerations for budding practitioners - Global insights highlighting practices around the world - Research insights inviting students to explore further academic research - Case Studies and Examples offering a more in-depth look at HRM across a variety of organizations - A free interactive eBook\* featuring author videos, web-links interactive multiple choice questions, free SAGE journal articles, extended case studies and other relevant links, allowing access on the go and encouraging learning and retention whatever the reading or learning style. Aimed at students across the academic spectrum, whether studying on a specialist HRM or CIPD program of study, a generalist business and management programme or studying HRM as part of a programme in an unrelated discipline (such as engineering or humanities). \*Interactivity only available through VitalSource eBook included as part of paperback product (ISBN 9781473954199). ## **Introduction to International Disaster Management**

The goal of machine learning is to program computers to use example data or past experience to solve a given problem. Many successful applications of machine learning exist already, including systems that analyze past sales data to predict customer behavior, optimize robot behavior so that a task can be completed using minimum resources, and extract knowledge from bioinformatics data. Introduction to Machine Learning is a comprehensive textbook on the subject, covering a broad array of topics not usually included in introductory machine learning texts. Subjects include supervised learning; Bayesian decision theory; parametric, semi-

parametric, and nonparametric methods; multivariate analysis; hidden Markov models; reinforcement learning; kernel machines; graphical models; Bayesian estimation; and statistical testing. Machine learning is rapidly becoming a skill that computer science students must master before graduation. The third edition of Introduction to Machine Learning reflects this shift, with added support for beginners, including selected solutions for exercises and additional example data sets (with code available online). Other substantial changes include discussions of outlier detection; ranking algorithms for perceptrons and support vector machines; matrix decomposition and spectral methods; distance estimation; new kernel algorithms; deep learning in multilayered perceptrons; and the nonparametric approach to Bayesian methods. All learning algorithms are explained so that students can easily move from the equations in the book to a computer program. The book can be used by both advanced undergraduates and graduate students. It will also be of interest to professionals who are concerned with the application of machine learning methods.
